Verilog Size Checking

Equivalence-Based Typing Rules

The statement $\Gamma \mid n \vdash e : \tau, X$ mean:

> In the variable context Γ and the size context n, the size of the expression e is the value of the variable τ, with X the size-tagged set of equivalence classes of size variables.

So we have:

- $\Gamma : \mathcal{O} \to \mathbb{N}$ a mapping from operand to their size, with $\mathcal{O}$ the set of operands,

- $n \in \mathbb{N} \cup \{*\}$ a size context (with $*$ for the empty one),

- $e \in \mathcal{E}$, with $\mathcal{E}$ the set of expressions,

- $\tau \in \mathcal{V}$, with $\mathcal{V}$ the set of size variable,

- $X = (S, f)$ with $S \in 2^{\mathcal{V}}$ the set of equivalence classes and $f : S \to \mathbb{N}$ a size valuation for each equivalence class.

We use the following notations:

-
$$\bowtie \; : \begin{cases} \mathbb{N} \times (\mathbb{N} \cup \{*\}) & \to & \mathbb{N} \\ (m, *) & \mapsto & m \\ (m, n) & \mapsto & \max(m, n) \end{cases}$$

- $\Delta_X : \mathcal{V} \to \mathbb{N}$ the function that given a size variable x returns its size in the environment $X = (S, f)$. We have $\Delta_X(x) = f\left([x]_S\right)$ with $[x]_S$ the equivalence class of x in S.

- $\{v := s\}$: the declaration of a *fresh* size variable v.

$$\{v := s\} = (S, f)$$
$$S = \{\{v\}\}$$
$$f = \begin{cases} S & \to & \mathbb{N} \\ \{v\} & \mapsto & s \end{cases}$$

- $X/\alpha \sim \beta$ the operation that combines two classes. For the newly created class, the valuation function gives the maximum of the previous classes:

$$(S, f)/\alpha \sim \beta = (S', f')$$
$$S' = \left\{[\alpha]_S \sqcup [\beta]_S\right\} \sqcup S \setminus \left\{[\alpha]_S, [\beta]_S\right\}$$
$$f' = \begin{cases} S' & \to & \mathbb{N} \\ c & \mapsto & f(c) & \text{if } c \in S \setminus \left\{[\alpha]_S, [\beta]_S\right\} \\ c & \mapsto & \max\left(f\left([\alpha]_S\right), f\left([\beta]_S\right)\right) & \text{if } c = [\alpha]_S \text{ or } c = [\beta]_S \end{cases}$$

Base case

$$\frac{\Gamma(x) = m}{\Gamma \mid n \vdash x : v, \{v := m \bowtie n\}}$$
